

Integrating DevResults With External Tools

Last Modified on 01/04/2018 2:44 pm EST

DevResults allows users to formalize and systematize their data collection, storage, and display and reporting, but it also allows users to export their data to external data analysis and business intelligence (BI) tools like Tableau and Microsoft Power BI.

Exporting Data:

Most data analysis and BI tools allow users to import data in Excel format. To get an Excel copy of results you have entered into DevResults, navigate to the results page you need and select the export data option. For direct entry indicators, you will select the **Export all reporting period data** button.

The screenshot shows the DevResults interface for 'Sample Org Demo Haiti'. The 'Results' tab is active, displaying 'FY 2016 Q4'. The 'Dates' section includes a 'Reporting Cycle' dropdown set to 'FY Quarterly', and two date range pickers: 'Reporting Period Dates' (1 Jul 2016 to 30 Sep 2016) and 'Submission Period Dates' (1 Oct 2016 to 31 Dec 2016). Below the dates is a 'Status by Activity' table. The table has columns: Code, Short Name, Activity, Awarding Org, Partner Org, Status, and Locked. An orange arrow points to the 'Export all reporting period data' button located above the table's header row.

Code	Short Name	Activity	Awarding Org	Partner Org	Status	Locked?
BEST ARP	BEST ARP	Best Agricultural Research Program	MinAg	Parti pour la Promo...	Approved	

For data tables, you will select the **Download all** button.

DevResults

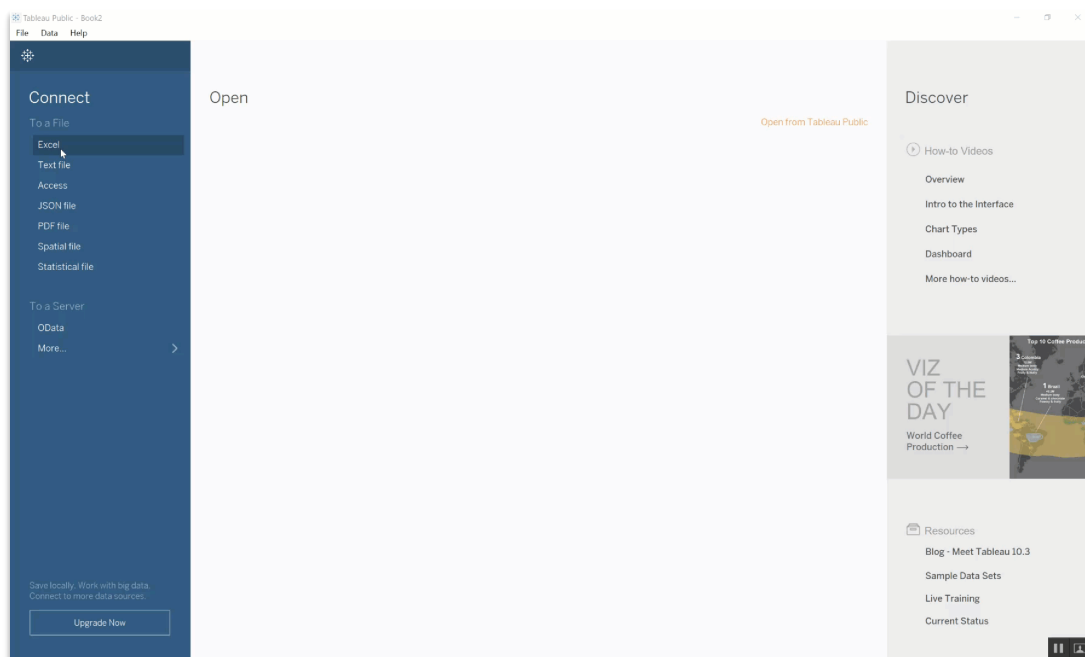

Remove this data table Delete this data table Done

Both these options will download a file to your chosen download folder.

Importing DevResults Data to an External Tool:

Once you have the Excel file, you can import the file directly into the data analysis or BI tool of your choice.

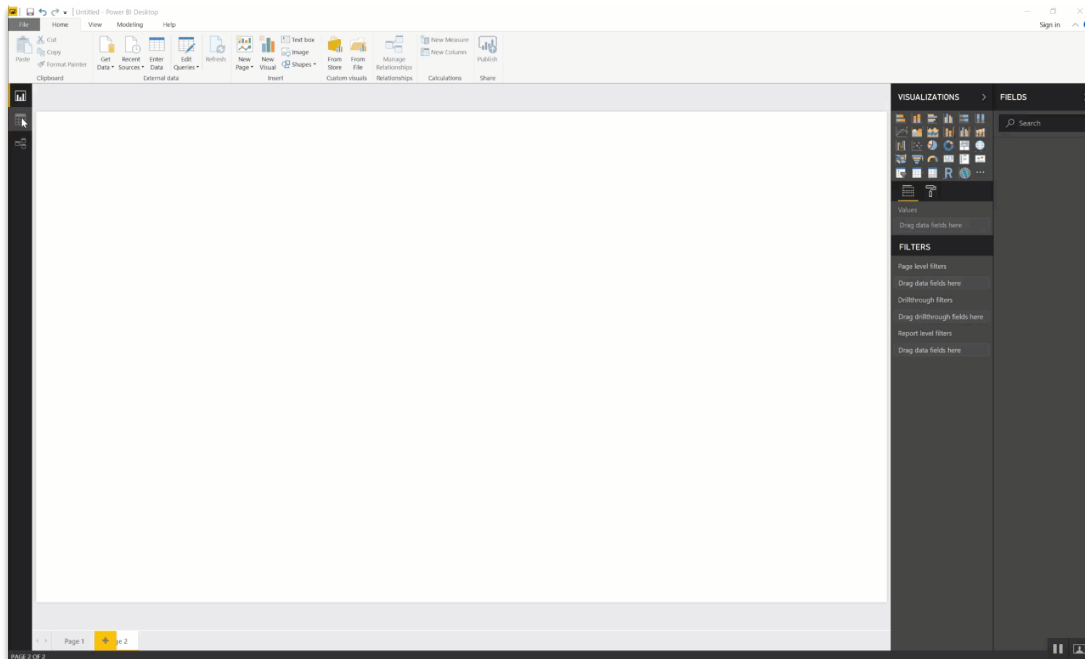

If you're using Tableau, you can **Connect to an Excel File**. Tableau will then give you the option to view the imported data and make any changes you need to.

You can then begin to use Tableau to analyze your data.

If you're using Microsoft Power BI, you can navigate to the data tab and select **Get Data**.

Power BI will give you the option to connect to Excel and select the file you exported from DevResults.

You can then begin to use Power BI to analyze your data.
