

Encrypted data in DevResults

Last Modified on 11/26/2018 6:51 pm EST

We take the security of our customers data very seriously at DevResults. DevResults is hosted on Microsoft Azure and all data in transit and at rest are encrypted by default. We selected Azure after much deliberation for several reasons, including their encryption at rest support. You can read more about Azure's encryption policy [here](#) and [here](#) .

We've created a diagram below to map the flow of data into DevResults with additional details on how that information is encrypted.

To learn more about how we protect your information, please see our [security policy](#) .
