Export Entire DevResults Instance

DevResults users with **owner** permissions can download the entire set of program information and indicator data that makes up their instance of DevResults.

This set of information includes:

- A set of JSON files that describe indicator results and their relationships to program information
- All data tables as Excel files
- All photos and documents in their original formats

To download this information, please see the **README** for the **InstanceExport/PowerShell** tool in our **DevResultsTools GitHub repository**. You will also need to reach out to us at us at **help@devresults.com** to request an Instance Export Manifest.

The downloaded data will be organized by key objects, like indicators and awards (i.e.: projects), and you will see folders for each key object containing files with data for each record. For example, the **Indicators** folder contains files with the definitions for indicator-related items and then a folder for each indicator (by IndicatorID) with the data reported for that indicator. For more information on how to interpret the exported data, please refer to our **API documentation**.

> **Note:** U.S. Government security requirements prohibit DevResults staff from downloading this information and then sending it to users. Users will need to follow the InstanceExport instructions.
